

PREFACE

The present work has been carried out during the period September 1954 to May 1959. It consists of studies in four different problems, viz. - (i) Energy transfer and sensitised luminescence in $\text{CaF}_2:(\text{Ce}+\text{In})$ system, (ii) The optical properties of $(\text{TlCl}+\text{KCl})$ phosphors, (iii) Reflectance spectra of $\text{KCl}:\text{Tl}$ phosphors, coloured by low energy electrons and (iv) absorption spectra of aqueous solutions of $\text{KCl}-\text{TlCl}$, $\text{NaCl}-\text{TlCl}$, and $\text{NH}_4\text{Cl}-\text{TlCl}$. In Chapter I, a brief General Introduction to the subject is given. In Chapter II, the scope and content of the present work and summary of the main results and conclusions are given. A brief summary is given at the end of each problem. Attempts have been made to consult previous work and collect references as far as practicable; it is however felt that it is still incomplete, since some of the sources are not available to the author.

I take this opportunity to thank Prof. N. N. Bose for suggesting the problem and guiding me throughout the work, to Dr. J. Sharma for helpful discussions and to Prof. S. Gupta for providing facilities to work. Lastly grateful thanks are due to Dr. S. R. Sengupta, Director of this Institute for the award of a scholarship during my stay at this Institute.
